(54) Title: SUTURE MATERIAL

(57) Abstract: A surgical suture material having either an external surface at least partially coated with an anti-microbial composition or an anti-microbial agent incorporated therein. Preferably the anti-microbial agent is a water-soluble metal ion-releasing glass in particle form.

WO 01/28601 A1

1    **SUTURE MATERIAL**

2

3    The present invention relates to a suture material  
4    having antimicrobial characteristics.

5

6    Sutures are the threads or wires used to stitch two  
7    bodily surfaces together. Typically, sutures are  
8    required to close surgical incisions and to treat deep  
9    lacerations inflicted on a patient.

10

11   Suture types fall into two main categories; absorbable  
12   and non-absorbable. Additionally, the sutures can be  
13   of monofilament or multifilament structure, with the  
14   multifilament sutures being braided or twisted. A  
15   variety of sizes of sutures are available. Typical  
16   commercially available suture types are listed below:

17

18   **Non-absorbable:**

19

20   Silk	twisted, braided & multifilament
21   Nylon polyamide	monofilament

- |    |   |                                |
|----|---|--------------------------------|
| 1  | Polypropylene   | monofilament                   |
| 2  | Polyester   | braided multifilament          |
| 3  | PTFE  | monofilament                   |
| 4  | PVDF  | monofilament                   |
| 5  | Stainless steel   | monofilament                   |
| 6  | Linen   | multifilament                  |
| 7  |   |                                |
| 8  | <b>Absorbable:</b>                                      |                                |
| 9  |   |                                |
| 10 | PGA   | monofilament & multifilaments  |
| 11 | PLA   | monofilament & multifilaments  |
| 12 | Lactide/Glycolide                                       |                                |
| 13 | Copolymers  | monofilaments & multifilaments |
| 14 | Catgut  | monofilament                   |
| 15 | Collagen  | monofilament                   |
| 16 |   |                                |
| 17 | In general braided multifilaments have a smoother       |                                |
| 18 | surface than the alternative twisted multifilaments and |                                |
| 19 | so remain more cohesive when stitched. Monofilaments,   |                                |
| 20 | being formed from a single fibre, cannot unravel and    |                                |
| 21 | thus lose cohesiveness.                                 |                                |
| 22 |   |                                |
| 23 | To improve the lubrication along the surface of the     |                                |
| 24 | suture and to provide friction to improve knot          |                                |
| 25 | strength, the sutures may be coated. Conventionally     |                                |
| 26 | however monofilament sutures are not coated. Coatings   |                                |
| 27 | which may be applied include 100% beeswax BP,           |                                |
| 28 | Silicone, PTFE (e.g. Teflon), PVP, polylactic acid      |                                |
| 29 | (PLA), polyglycolactide (PLG), polycaprolactones and    |                                |
| 30 | copolymers thereof. Often the coatings will             |                                |

1 incorporate detergents or other lubricating substances,  
2 e.g. calcium stearate.

3

4 However, sutures used for surgical wound closure are  
5 associated with increased bacterial infectivity.  
6 Sutures draw contaminants into the wound closure and  
7 provide a surface along which micro-organisms can track  
8 as a biofilm. Contamination of the wound via the  
9 suture can arise from the local environment  
10 (particularly in gut surgery), the closure area around  
11 the wound, inappropriate handling of the suture or from  
12 contaminated suture stock.

13

14 It is an object of the present invention to reduce the  
15 risk of infection due to suturing a wound, by providing  
16 sutures having antimicrobial characteristics.

17

18 Thus, in one aspect, the present invention provides a  
19 surgical suture material having either:

20

21 a) an external surface at least partially coated with  
22 an anti-microbial composition comprising an anti-  
23 microbial agent; or

24

25 b) an anti-microbial agent incorporated therein.

26

27 The surgical suture material may be formed from any  
28 suitable substance and may be absorbable or non-  
29 absorbable. Mention may be made of silk, polyester,  
30 nylon, polypropylene, polyvinylidene fluoride, linen,  
31 steel wire, catgut (beef serosa or ovine submucosa),

1 polyglycolactide, polyamide (e.g. polyamide nylon),  
2 fibroin, polyglycolic acid and copolymers thereof. The  
3 sutures may be monofilament or may be braided or  
4 twisted multifilament yarns.

5  
6 The anti-microbial composition if to be applied as a  
7 coating may be applied to the suture surface in the  
8 same way as a conventional coating. Indeed, a  
9 conventional coating material admixed with or including  
10 an anti-microbial agent is suitable for use in the  
11 present invention.

12  
13 Preferably the anti-microbial agent is biodegradable  
14 over a period of time compatible with the timescale of  
15 wound healing. A slow-release of the anti-microbial  
16 active ingredient of the agent over a period of weeks  
17 or months is thus desirable.

18  
19 A preferred anti-microbial agent is a water-soluble  
20 metal ion-releasing glass, especially in particle (e.g.  
21 fine powder) form that may be simply admixed with a  
22 conventional coating and applied to the suture  
23 material. Advantageously the metal released by the  
24 glass is silver.

25  
26 Thus we have found that by incorporating a comminuted  
27 anti-microbial water soluble glass either into the  
28 suture material itself or coated onto the external  
29 surface thereof, the infectivity of a wound site is  
30 reduced, whilst the handling characteristics  
31 (knotability and insertion lubricity) are maintained.

1. Phosphorous pentoxide ( $P_2O_5$ ) is preferably used as the  
2 glass former of the biodegradable glass used in the  
3 coating.

4

5 Generally the mole percentage of phosphorous pentoxide  
6 in the glass composition is less than 85%, preferably  
7 less than 60% and especially between 30-60%.

8

9 Alkali metals, alkaline earth metals and lanthanoid  
10 oxides or carbonates are preferably used as glass  
11 modifiers. Generally, the mole percentage of alkali  
12 metals, alkaline earth metals and lanthanoid oxides or  
13 carbonates is less than 60%, preferably between 40-60%.

14

15 Boron containing compounds (eg  $B_2O_3$ ) are preferably used  
16 as glass additives. Generally, the mole percentage of  
17 boron containing compounds is less than 15% or less,  
18 preferably less than 5%.

19

20 Other compounds may also be added to the glass to  
21 modify its properties, for example  $SiO_2$ ,  $Al_2O_3$ ,  $SO_3$ ,  
22 sulphate ions ( $SO_4^{2-}$ ), transition metal compounds (eg.  
23 first row transition metal compounds) or mixtures  
24 thereof.

25

26 Typically the soluble glasses used in this invention  
27 comprise phosphorus pentoxide ( $P_2O_5$ ) as the principal  
28 glass-former, together with any one or more  
29 glass-modifying non-toxic materials such as sodium  
30 oxide ( $Na_2O$ ), potassium oxide ( $K_2O$ ), magnesium oxide  
31 ( $MgO$ ), zinc oxide ( $ZnO$ ) and calcium oxide ( $CaO$ ) or

1 mixtures thereof. The rate at which the glass  
2 dissolves in fluids is determined by the glass  
3 composition, generally by the ratio of glass-modifier  
4 to glass-former and by the relative proportions of the  
5 glass-modifiers in the glass. By suitable adjustment  
6 of the glass composition, the dissolution rates in  
7 water at 38°C ranging from substantially zero to  
8 25mg/cm<sup>2</sup>/hour or more can be designed. However, the  
9 most desirable dissolution rate R of the glass is  
10 between 0.01 and 2.0mg/cm<sup>2</sup>/hour.

11  
12 The water-soluble glass is preferably a phosphate  
13 glass, and preferably comprises a source of silver ions  
14 which may advantageously be introduced during  
15 manufacture as silver orthophosphate (Ag<sub>3</sub>PO<sub>4</sub>). The  
16 glass preferably enables controlled release of silver  
17 or other metal ions, for example Zn, Cu, Mg, Ce, Mn,  
18 Bi, Se, Cs and mixtures thereof (preferably Ag, Cu, Zn  
19 and Mg and mixtures thereof) and other constituents in  
20 the glass and the content of these additives can vary  
21 in accordance with conditions of use and desired rates  
22 of release, the content of silver generally being up to  
23 5 mole %. While we are following convention in  
24 describing the composition of the glass in terms of the  
25 mole % of oxides, of halides and of sulphate ions, this  
26 is not intended to imply that such chemical species are  
27 present in the glass nor that they are used for the  
28 batch for the preparation of the glass.

29  
30 The optimum rate of release of the metal ions (eg Ag,  
31 Cu, Zn or Mg, or any of the other metal ions mentioned

1 above) into an aqueous environment may be selected by  
2 circumstances and particularly by the specific function  
3 of the released metal ion. The invention provides a  
4 means of delivering metal ions to an aqueous medium at  
5 a rate which will maintain a concentration of metal  
6 ions in said aqueous medium of not less than 0.01 parts  
7 per million and not greater than 10 parts per million.  
8 In some cases, the required rate of release may be such  
9 that all of the metal added to the system is released  
10 in a short period of hours or days and in other  
11 applications it may be that the total metal be released  
12 slowly at a substantially uniform rate over a period  
13 extending to months or even years. In particular cases  
14 there may be additional requirements, for example it  
15 may be desirable that no residue remains after the  
16 source of the metal ions is exhausted or, in other  
17 cases, where the metal is made available it will be  
18 desirable that any materials, other than the metal  
19 itself, which are simultaneously released should be  
20 physiologically harmless. In yet other cases, it may  
21 be necessary to ensure that the pH of the resulting  
22 solution does not fall outside defined limits.

23

24 Generally, the mole percentage of these additives in  
25 the glass is less than 25%, preferably less than 10%.

26

27 In a preferred embodiment the biodegradable glass  
28 comprises 20-35 mole%  $\text{Na}_2\text{O}$ ; 18-30 mole%  $\text{CaO}$  and 45-60  
29 mole%  $\text{P}_2\text{O}_5$ .

30

1 It is a further object of the invention to provide a  
2 method of reducing the risk of infection and provide  
3 faster and more efficient healing of the wound by using  
4 the suture material of the invention to close the  
5 wound.

6

7 The present invention will now be further described by  
8 reference to the following, non-limiting, examples and  
9 to figures, in which:

10

11 Fig. 1 : shows the template used in the example  
12 to facilitate regular application of the  
13 suture lengths on the plates.

14

15 Figs. 2-6 : show digitally generated photographic  
16 images showing the results of Example 2.

17

18 EXAMPLE 1: Suture Coating Preparation

19

20 Glasses were prepared according to Table 1.

21

22

23

24

11.28	12.20	36	11.5	47.5	5.0	08

3

4 These glasses were prepared as powders (mode size given  
5 in  $\mu$ m in Table 1 above) for incorporation into a suture  
6 coating.

7

8 Testing

9

10 Physical/Mechanical

11

12 It is important that addition of silver ion releasing  
13 glass into the coating does not compromise the physical  
14 or mechanical properties of the suture. The smoothness  
15 of the coating is essential in ensuring smooth  
16 insertion of the suture. The coating should not slough  
17 off on insertion and the knot properties should not be

1 reduced. Test samples show that up to 2.5% wt/wt  
2 (final dry weight of coating) of glass powder could be  
3 added to the coating without affecting these properties  
4 and up to 5% wt/wt may be possible with some samples.

5

#### 6 Samples

7

8 Glass samples 01 and 04 were applied to  
9 glycolide/lactide copolymer braided multifilament  
10 sutures in a glycolide/caprolactone coating at various  
11 weights. The coat weight applied was 2% wt/wt dry  
12 weight coating onto the suture. Samples G1 to G10  
13 contain glass 01 from 0.25-2.5% wt/wt dry weight in the  
14 coating. G11 to G20 contain glass 04 at 0.25 to 2.5%  
15 wt/wt dry weight in the coating. G21 is a nylon  
16 monofilament with 2% wt/wt coating containing 2.5%  
17 wt/wt of 04. This coating did not bond well with the  
18 suture G22 and G23 and control copolymer and control  
19 nylon sutures respectively.

20

#### 21 EXAMPLE 2: Anti-microbial Activity

22

23 G1 to G23 were screened against 17 test organisms.

24

#### 25 Suture Material

26

27 G1 to G20-Violet Polysorb size 0 sutures

28 G21-Dacron suture size 2/0

29 G22-Violet Polysorb control

30 G23-Dacron control

31

1 Test Organisms

2

3 A panel of "wild-type" clinical isolates was used  
4 except for organism 5, *Staph epidermidis* NCTC 11047.  
5 This organism is a reference organism noted to be  
6 sensitive to test sutures utilised in a previous  
7 experiment.

8

9 Gram-positive Isolates

10

- 11 1. *Enterococcus faecalis*  
12 2. *Staphylococcus aureus*  
13 3. *Enterococcus faecalis* - vancomycin resistant (VRE  
14 - VanA genotype)  
15 4. Methicillin-resistant *Staphylococcus aureus* (MRSA  
16 - epidemic type 15)  
17 5. *Staphylococcus epidermidis* NCTC 11047.  
18 6. *Streptococcus agalactiae* (Group B streptococcus)

19

20 Gram-negative Isolates

21

- 22 7. *Stenotrophomonas maltophilia* (formerly *Xanthomonas*  
23 *maltophilia*)  
24 8. *Pseudomonas aeruginosa* - strain 1  
25 9. *Pseudomonas aeruginosa* - strain 2  
26 10. *Serratia marcescens*  
27 11. *Enterobacter cloacae*  
28 12. *Morganella morganii*  
29 13. *Escherichia coli*  
30 14. *Klebsiella pneumoniae*  
31 15. *Acinetobacter sp.*

1 Yeasts

2

3 16. *Candida albicans*

4 17. *Candida glabrata*

5

6 Method

7

8 *Media* - 9 cm plates of Oxoid Iso-sensitest agar were  
9 used for all organisms except the *candida* isolates  
10 which were plated on Yeast Morphology Agar.

11

12 *Inoculum* - Overnight plate cultures of the test  
13 organisms were emulsified in physiological saline to  
14 achieve a semi-confluent growth on the agar plates.

15

16 *Inoculum procedure* - The plates were pre-dried at 37°C  
17 for 2 hours. The inoculum was applied using a sterile  
18 swab using a cross-streaking technique.

19

20 *Suture application* - The suture was cut into  
21 approximate 1 cm lengths using sterile instruments.  
22 Where possible, straight sections of suture were used.  
23 A template was constructed to facilitate regular  
24 application of the suture lengths. Each plate of test  
25 organism had the series of 21 test and 2 control  
26 sutures applied, with a replicate of suture G1 as an  
27 internal control on the far side of the plate (see  
28 Figure 1 for template). Each suture was pressed down  
29 with sterile forceps to optimise contact with the agar  
30 surface.

31

1 Incubation - 37°C for 18 hours. The plates were  
2 reassessed after a further 24 hours.

3

4 *Recording of results* - The maximum width of the zone of  
5 inhibition at right angles to the suture length was  
6 recorded to nearest 0.5 mm (the maximum width was  
7 recorded to avoid skewing of results due to incomplete  
8 contact of parts of the suture with the agar surface,  
9 resulting in irregular zones - see photographic  
10 results).

11

#### 12 Results

13

14 See digitally generated photographic images provided as  
15 Figs. 2 to 6 and Table 2.

16

#### 17 Conclusions

18

##### 19 **G21-Dacron suture:**

20 Zones of inhibition were seen with all test organisms  
21 except *Candida albicans* (organism 16).

22

##### 23 **G23-Dacron control suture:**

24 No demonstrable activity.

25

##### 26 **G1-G20-violet Polysorb suture:**

27 There was a general trend towards increasing activity  
28 with the higher Polysorb suture numbers, with zone  
29 sizes plateauing with G14, 15 and 16 followed by a  
30 slight decline.

31

1 Activity was seen against most organisms in the panel.  
2 No zones were seen with two candida isolates (organisms  
3 16 and 17) and the zones for *Stenotrophomonas*  
4 *maltophilia* (organism 7) and *Enterobacter cloacae*  
5 (organism 11) tended to be smaller, or absent compared  
6 to the other Gram-negative isolates.  
7  
8 Activity against the staphylococcal isolates (organisms  
9 2, 4 and 5) was seen with virtually all sutures. This  
10 is of note given the particular importance of  
11 staphylococci in the aetiology of stitch abscesses.  
12  
13 The enterococci and streptococci (organisms 1, 3 and 6)  
14 demonstrated the largest zones of inhibition.  
15 Interestingly, the control suture (G22) also yielded  
16 significant zones for all three organisms, indicating  
17 that one of the constituents of the suture has  
18 antimicrobial activity in its own right. This  
19 constituent must be released from the suture and be  
20 able to diffuse through the agar. There is apparent  
21 interaction with the components of the test sutures -  
22 G2 consistently gave zones smaller than the control.  
23  
24 As will be seen from the digital images (Figs. 2 to 6)  
25 the inoculum ranged from semi-confluent to near  
26 confluent growth. The Gram-negative organisms tended  
27 to a heavier inoculum. Despite the significant  
28 challenge, zones of inhibition were seen. At this  
29 stage the duration of activity of the test sutures  
30 cannot be stated - however, transient contact with the

1 surface of the agar (duration less than 5 seconds)  
2 resulted in a small zone of inhibition.

3

4 EXAMPLE 3: Anti-microbial Activity

5

6 Protocol

7

8 As for Example 2.

9

10 The experiment was performed to confirm the results  
11 from the previous experiment, in particular the  
12 activity of the G22 control suture against the  
13 enterococci and streptococci, and the effect of a lower  
14 inoculum on the results from the Gram-negative  
15 organisms.

16

17 Results

18

19 See Table 3.

1 Table 3 : Maximum width of zone of inhibition measured  
2 at right angles to the suture (millimetres)  
3

ORGANISM				
	1 Enterococcus	5 Staph 11047	6 Gp B strept	13 E Coli
Suture				
G4	9 m	2 m	8 m	0 m
G9	9 m	2.5 m	9 m	1 m
G11	8 m	2.5 m	10 m	1.5m
G14	7.5 m	3.5 m	9 m	2 m
G17	8 m	2.5 m	8 m	2 m
G22	9 m	0 m	12 m	0 m

4 Key: m - microcolonies present within zone of inhibition  
5

6 Conclusions  
7

8 Zone sizes were similar to the results from Example 2.  
9 Control suture G22 again demonstrated activity against  
10 both enterococci and Gp B streptococci. The zone sizes  
11 for the E coli using a lighter inoculum were similar to  
12 previous results.  
13

14 EXAMPLE 4: Controlled Release  
15

16 Suture Material  
17

18 G11 - previously noted to yield a small zone of  
19 inhibition with NCTC 11047.

1 G16 - previously noted to yield a large zone of  
2 inhibition with NCTC 11047.

3

4 Test organism

5

6 *Staphylococcus epidermidis* NCTC 11047.

7

8 Method

9

10 A single plate of Oxoid Iso-sensitest agar (Plate 1)  
11 was seeded with the test organism to achieve a semi-  
12 confluent growth. Four G11 sutures were applied to one  
13 side of the plate, with four G16 sutures on the  
14 opposite side. Each suture had been bent to yield a 90°  
15 kink in the middle. After 24 hours incubation at 37°C  
16 the zones of inhibition at right angles to the sutures  
17 were recorded and the sutures were transferred to a  
18 freshly seeded Iso-sensitest plate (Plate 2). The kink  
19 in the suture ensured that the same aspect of the  
20 suture was in contact with the agar surface on each  
21 occasion. The new plate was incubated for a further 24  
22 hours and the sutures were removed prior to assessment  
23 of zones of inhibition.

24

25 Results

26

27 Plate 1 - Each of the G11 sutures yielded a zone of  
28 inhibition 1.5 mm in (maximum) width. The G16 sutures  
29 yielded zones 2.0 mm in width.

30

1 Plate 2 - After transfer to Plate 2, zones of  
2 inhibition were not seen for either suture. On removal  
3 of the sutures it was observed that there was confluent  
4 growth of the test organism under the G11 sutures, but  
5 there was inhibition of growth under G16.

6  
7 Conclusions

8  
9 After 24 hours in contact with the agar surface of  
10 Plate 1, suture G11 had no demonstrable activity  
11 against the test organism on Plate 2. Suture G16  
12 demonstrated marginal activity on Plate 2, with  
13 inhibition of growth directly underneath the suture  
14 material.

15  
16 EXAMPLE 5: Controlled Release

17  
18 Suture material

19  
20 G15 - previously noted to yield a large zone of  
21 inhibition with NCTC 11047.

22  
23 Test organism

24  
25 *Staphylococcus epidermidis* NCTC 11047.

26 Method

27  
28 A single plate of Oxoid Iso-sensitest agar was seeded  
29 to yield a semi-confluent growth of NCTC 11047.  
30 Sixteen sutures were applied with sterile forceps and  
31 the plate was incubated at 37°C. At various time

1 intervals sutures were removed. Two sutures were  
2 assessed for each time, except for "24 hours" where 4  
3 sutures were used. At the end of the 24-hour period  
4 the zones of inhibition were assessed and the plate was  
5 photographed.

6  
7 Results and Conclusions

8  
9 Suture G15 exhibited activity against the test organism  
10 when in contact with the agar surface for only 5  
11 minutes. Activity increases up to the 3 hour point,  
12 after which no increased activity is seen.

13  
14 EXAMPLE 6: Duration of Anti-microbial effect

15  
16 Suture

17  
18 G16.

19  
20 Test organism

21  
22 *Staphylococcus epidermidis* NCTC 11047.

23  
24 Method

25  
26 An Oxoid Iso-sensitest agar plate was seeded with the  
27 test organism to achieve a semi-confluent growth. Six  
28 G16 sutures were applied with sterile forceps and the  
29 plate was incubated for 24 hours at 37°C. An  
30 uninoculated Iso-sensitest plate was also incubated as  
31 the Control.

1 After the initial incubation period each suture was  
2 surrounded by a zone of inhibition. Three of the six  
3 sutures were then removed. Each zone of inhibition was  
4 challenged using a calibrated loop to apply a drop of  
5 standardised suspension of test organism. Each drop  
6 contained approximately  $10^4$  colony forming units. An  
7 identical drop was applied to the Control plate. Both  
8 plates were then incubated for a further 24 hours and  
9 the zones were challenged again, and a further drop was  
10 added to the Control plate. The procedure was repeated  
11 on a daily basis. The end point of the experiment was  
12 when growth appeared in the original zones of  
13 inhibition following challenge, or when the Control  
14 plate lost the ability to support organism growth due  
15 to progressive dehydration. (This was minimised by  
16 incubating the plates in an atmosphere with high  
17 humidity.)

18

19 Results

20

21 Over the thirteen days of the experiment, no growth was  
22 seen in any of the zones of inhibition. There was no  
23 difference between the zones where the suture remained  
24 in place and the zones where the suture had been  
25 removed. The experiment was terminated at the 13 day  
26 point even though the Control plate continued to  
27 support growth of the challenge organism. This was  
28 because the test plate appeared to be dehydrating more  
29 rapidly, presumably because of the influence of the  
30 lawn of growth of NCTC 11047 on its surface.

31

1 Conclusions

2

3 Experiment 1 demonstrated that much of the activity of  
4 the suture is released in the first 24 hours.

5 Experiment 2 showed that activity is present within 5

6 minutes of contact with the agar. Experiment 3

7 illustrates that even though the suture may be

8 depleted, the surrounding area returns antimicrobial

9 activity over a period in excess of one week.

10

11 EXAMPLE 7: Cytotoxicity

12

13 1. Objective

14

15 To determine the cytotoxicity of a series of suture  
16 samples using a standard extraction/elution test, after  
17 ISO 10993 part 5.

18

19 2. Scope

20

21 The test procedure applies to all suture samples which  
22 were received sterile.

23

24 3. Equipment and Materials

25 3.1 Equipment

26 3.1.1 Laminar air flow hood.

27 3.1.2 Incubator maintained at 37°C/5% carbon  
28 dioxide.

29 3.1.3 Refrigerator at 4°C.

30 3.1.4 Freezer at -18°C.

31 3.1.5 Vacuum source.

1           3.1.6       Phase contrast microscope.

2

3    3.2   Materials

4           3.2.1       Sterile plastic-ware pipettes.

5           3.2.2       Sterile glass pipettes.

6           3.2.3       24 well sterile dishes.

7           3.2.4       Surgical grade forceps.

8           3.2.5       Surgical grade scissors.

9           3.2.6       Sterile Universal containers.

10          3.2.7       L929 cell culture line (ATCC NCTC Clone  
11                       929).

12          3.2.8       TCPS negative control.

13          3.2.9       Natural rubber latex control.

14          3.2.10      Other control samples were supplied in  
15                       suture form.

16

17   4. Procedure

18

19   4.1   Test sample preparation

20          4.1.1       Test samples and controls were cut to  
21                       the appropriate size (see Section  
22                       4.2.1).

23          4.1.2       Tissue culture polystyrene was employed  
24                       as a negative control. Natural rubber  
25                       latex was employed as a positive  
26                       control. The controls were not in the  
27                       same physical form as the test material.

28

29   4.2   Extraction/elution method

30

1 All procedures carried out within laminar air  
2 flow.

3 4.2.1 Sutures were prepared to provide a  
4 surface area equivalent to 120 cm sq.  
5 for each 20 mL of extracting medium.

6 4.2.2 Suture samples (typically 6 cm in  
7 length) were transferred to Sterile  
8 Universal containers.

9 4.2.3 Each container was labelled with the  
10 test material code number.

11 4.2.4 20 mL of mammalian cell culture medium  
12 (199) was added to each container.

13 4.2.5 The containers were placed in the  
14 incubator 37°C/5% carbon dioxide for 24  
15 hours.

16

#### 17 4.3 Cell preparation

18 4.3.1 A cell subculture was prepared on the  
19 same day the extracts were initiated.

20 4.3.2 Cells were plated into 24 well dishes at  
21 a cell concentration of approximately  $1 \times 10^5$  cells/mL. Enough wells were  
22 prepared to allow four wells per test  
23 sample. 2 mL of serum supplemented  
24 medium was added to each well.

25 4.3.3 The 24-well plates were incubated for 24  
26 hours at 37°C/5% carbon dioxide.

27

#### 28 4.4 Test procedure

29 4.4.1 After 24 hours all 24 well plates were  
30 examined by phase-contrast microscope  
31

1 (x20 objective lens) to ensure healthy  
2 monolayer of >80% confluence.

3 4.4.2 The culture medium is aspirated.

4 4.4.3 The Universal containers are removed  
5 from the extraction conditions, the pH  
6 monitored using phenol red indicator.

7 4.4.4 2 mL of extracted medium is placed in  
8 each well and the plates re-incubated  
9 for a 48-hour period.

10

11 4.5 Interpretation of results

12 4.5.1 At the conclusion of the incubation  
13 period the plates are removed from the  
14 incubator and examined under phase  
15 contrast microscope using x10 and x20  
16 objective lenses.

17 4.5.2 Each test and control material was  
18 evaluated using the scoring system  
19 detailed below.

Reactivity Response Table		
Grade	Reactivity	Conditions of all cultures
0	None	Discrete intracytoplasmic granules; no cell lysis
1	Slight	No more than 20% of the cells are round, loosely attached and without intracytoplasmic granules; occasional lysed cells are present
2	Mild	No more than 50% of the cells are round and devoid of intracytoplasmic granules; extensive cell lysis and empty areas between cells
3	Moderate	No more than 70% of the cell layers contain rounded cells and/or are lysed
4	Severe	Nearly complete destruction of the cell layers

## 1 4.6 Results

2

3 The following table (Table 4) highlights the  
 4 results obtained following two separate tests:  
 5 Two readings were taken at each test. In all  
 6 cases negative control (TCPS) provided a 0 grade  
 7 and positive control provided a 2 grade.

8

9 Table 4

Material Code	Grade Test 1		Test 2		Material Code	Grade Test 1		Test 2		Material Code	Grade Test 1		Test 2	
G1	0	0	0	0	G9	0	0	0	0	G17	1	0	0	0
G2	0	0	0	0	G10	0	0	0	0	G18	1	0	0	0

G8	0	0	0	0	G16	1	1	0	0					

10

11 Comments

12

13 The results as detailed provide a very subjective  
 14 assessment of material cytotoxicity. Where a grade 0 is  
 15 shown, there was no evidence of toxicity and a  
 16 confluent healthy monolayer of cells was present.  
 17 Where there was any evidence of floating cells or  
 18 morphological abnormality or sub-confluent growth a  
 19 grade 1 was allocated. It should be noted that  
 20 floating cells do not necessarily indicate toxicity.  
 21 It should also be noted that the test 2 indicated less  
 22 evidence of toxicity than test 1. The extracts (with

- 1 suture material removed) had been maintained in a
- 2 frozen state for 72 hours before re-testing.

1   **Claims :**

2

3   1.   A surgical suture material having either:

4

5       a)   an external surface at least partially coated  
6           with an anti-microbial composition comprising  
7           an anti-microbial agent; or

8       b)   an anti-microbial agent incorporated therein.

9

10   2.   The suture material as in Claim 1, wherein said  
11       material is selected from silk, polyester, nylon,  
12       polypropylene, polyvinylidene fluoride, linen,  
13       steel wire, catgut, polyglycolactide, polyamide,  
14       fibroin, polyglycolic acid and copolymers thereof.

15

16   3.   The suture material as claimed in Claim 1 or 2,  
17       wherein said material is selected from  
18       monofilament, braided multi-filament and twisted  
19       multifilament yarns.

20

21   4.   The suture material as claimed in any one of  
22       Claims 1 to 3, wherein said anti-microbial  
23       composition is coated on the suture surface.

24

25   5.   The suture material as claimed in any one of  
26       Claims 1 to 4, wherein said anti-microbial agent  
27       is biodegradable.

28

29   6.   The suture material as claimed in any one of  
30       Claims 1 to 5, wherein said anti-microbial agent  
31       is admixed with a coating material.

- 1 7. The suture material as claimed in any one of  
2 Claims 1 to 6, wherein said anti-microbial agent  
3 is a water-soluble metal ion-releasing glass.  
4
- 5 8. The suture material as claimed in Claim 7, wherein  
6 said glass is in particle form.  
7
- 8 9. The suture material as claimed in Claim 7 or 8,  
9 wherein said glass enables controlled release of  
10 metal ions selected from Ag, Zn, Cu, Mg, Ce, Mn,  
11 Bi, Se, Cs and mixtures thereof.  
12
- 13 10. The suture material as claimed in Claim 9, wherein  
14 said glass enables controlled release of metal  
15 ions selected from Ag, Cu, Zn, Mg and mixtures  
16 thereof.  
17
- 18 11. The suture material as claimed in any one of  
19 Claims 7 to 10, wherein said glass releases silver  
20 ions.  
21
- 22 12. The suture material as claimed in any one of  
23 Claims 7 to 11, wherein said glass comprises a  
24 source of silver ions which is introduced during  
25 manufacture as silver orthophosphate ( $\text{Ag}_3\text{PO}_4$ ).  
26
- 27 13. The suture material as claimed in any one of  
28 Claims 7 to 12, wherein said glass comprises up to  
29 5 mole % of silver.  
30

- 1 14. The suture material as claimed in any one of  
2 Claims 7 to 13, wherein said glass comprises  
3 phosphorous pentoxide ( $P_2O_5$ ) as a glass former.  
4
- 5 15. The suture material as claimed in Claim 14,  
6 wherein the mole percentage of phosphorous  
7 pentoxide in the glass composition is less than  
8 85%, preferably less than 60% and especially  
9 between 30 and 60%.  
10
- 11 16. The suture material as claimed in any one of  
12 Claims 7 to 15, wherein said glass comprises a  
13 glass modifier selected from alkali metals,  
14 alkaline earth metals, lanthanoid oxides,  
15 lanthanoid carbonates and mixtures thereof.  
16
- 17 17. The suture material as claimed in any one of  
18 Claims 14 to 16, wherein said glass comprises a  
19 glass modifier selected from sodium oxide ( $Na_2O$ ),  
20 potassium oxide ( $K_2O$ ), magnesium oxide ( $MgO$ ), zinc  
21 oxide ( $ZnO$ ), calcium oxide ( $CaO$ ) and mixtures  
22 thereof.  
23
- 24 18. The suture material as claimed in Claims 16 or 17,  
25 wherein the mole percentage of said glass modifier  
26 is less than 60%, preferably between 40 and 60%.  
27
- 28 19. The suture material as claimed in any one of  
29 Claims 7 to 18, wherein said glass comprises a  
30 boron containing compound.  
31

- 1 20. The suture material as claimed in Claim 19,  
2 wherein the mole percentage of said boron  
3 containing compound is less than 15%, preferably  
4 less than 5%.  
5
- 6 21. The suture material as claimed in any one of  
7 Claims 7 to 20, wherein said glass comprises an  
8 additive compound selected from  $\text{SiO}_2$ ,  $\text{Al}_2\text{O}_3$ ,  $\text{SO}_3$ ,  
9 sulphate ions ( $\text{SO}_4^{2-}$ ), transition metal compounds  
10 and mixtures thereof.  
11
- 12 22. The suture material as claimed in any one of  
13 Claims 7 to 21, wherein said glass has a  
14 dissolution rate in water at  $38^\circ\text{C}$  in the range from  
15 substantially zero to  $25\text{mg}/\text{cm}^2/\text{hour}$ .  
16
- 17 23. The suture material claimed in Claim 22, wherein  
18 said dissolution rate is in the range from 0.01 to  
19  $2.0\text{ mg}/\text{cm}^2/\text{hour}$ .  
20
- 21 24. The suture material as claimed in any one of  
22 Claims 7 to 23 wherein said glass comprises 20-35  
23 mole %  $\text{Na}_2\text{O}$ , 18-30 mole %  $\text{CaO}$  and 45-60 mole %  
24  $\text{P}_2\text{O}_5$ .

# INTERNATIONAL SEARCH REPORT

International Application No

PCT/GB 00/04049

**A. CLASSIFICATION OF SUBJECT MATTER**  
IPC 7 A61L17/00 A61B17/06

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 7 A61L A61B

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, WPI Data

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	EP 0 633 032 A (SUMITOMO ELECTRIC INDUSTRIES, LTD.) 11 January 1995 (1995-01-11) the whole document	1-11
X	EP 0 328 421 A (THE TRUSTEES OF COLUMBIA UNIVERSITY IN THE CITY OF NEW YORK) 16 August 1989 (1989-08-16) the whole document	1-11
X	US 5 413 788 A (EDWARDS ET AL.) 9 May 1995 (1995-05-09) abstract column 1, line 5-15 column 3, line 40-63 column 5, line 44-51 column 5, line 61 -column 6, line 31 --- -/-	1,4, 6-13,21

☒ Further documents are listed in the continuation of box C.

☒ Patent family members are listed in annex.

### \* Special categories of cited documents:

- \*A\* document defining the general state of the art which is not considered to be of particular relevance
- \*E\* earlier document but published on or after the international filing date
- \*L\* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- \*O\* document referring to an oral disclosure, use, exhibition or other means
- \*P\* document published prior to the international filing date but later than the priority date claimed

\*T\* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

\*X\* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

\*Y\* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

\*A\* document member of the same patent family

Date of the actual completion of the international search

25 January 2001

Date of mailing of the international search report

31/01/2001
